LASER

Laser hair removal is one of the most commonly practiced cosmetic procedures in the United States. A highly concentrated light is beamed through the skin and absorbed into the hair follicle residing just below the skin's surface. The follicle is destroyed by heat that is generated from the laser energy.

ELECTROLYSIS

Electrolysis is a method used to remove individual hairs from the face and body. Medical electrolysis devices work by destroying the growth center of the hair with chemical or heat energy, as very fine probe is inserted into the hair follicle at the surface of the skin. Tweezers are then used to remove the hair.

SKIN REJUVENATION

Beginning Fall 2021

Skin Rejuvenation results in smaller pores, a more even skin tone, softer texture, and a reduction in fine lines and acne scars. Laser energy gently penetrates the skin and stimulates the collagen fibers, working to improve the skin's structure. The results are gradually visible as collagen takes time to grow. Improvement continues over several weeks, and after multiple (4-6) sessions, dramatic changes can be seen. This service pairs with facial chemical peels.
